

Nostavia Technologies Pvt. Ltd.

Company Description

The intelligence layer for the health economy.

Lucknow, Uttar Pradesh, India | nostaviahealth.com | July 2026

1. Summary

Nostavia Technologies Pvt. Ltd. is a B2B health-tech infrastructure company. It builds a whole-body health-intelligence layer that diagnostic labs, clinics, wellness platforms, fitness apps and insurers embed inside their own products, under their own brand.

The health economy collects enormous quantities of data but cannot interpret it. Products stop at activity tracking, generic diet plans and one-time lab reports. Nostavia supplies the interpretation layer: it ingests medical records, wearable signals and nutrition data, decodes over 100 biomarkers, models whole-body correlations, and returns adaptive protocols and a continuous AI companion. Partners keep their users and their interface; Nostavia remains invisible.

The company describes itself as the “Stripe for metabolic health”: it does not compete with health companies for end users, it powers them, and is paid a recurring platform fee. The full stack is live in production today, and the company has billed approximately ₹4.55 lakhs in revenue across FY 2024–25 and FY 2025–26. Nostavia is raising a \$100,000 pre-seed round.

2. The problem

A large health economy — fitness applications, diagnostic chains, insurers and wellness platforms — shares a single blind spot. Each collects health data, and none converts it into continuous, adapting intelligence. The result is products that measure but do not interpret.

Three facts define the opportunity:

- Approximately 74% of deaths worldwide are now caused by non-communicable, lifestyle-driven disease — conditions that are continuously monitorable. (Source: World Health Organization.)
- Approximately 589 million adults worldwide live with diabetes, roughly one in nine, projected to rise about 45% by 2050. (Source: IDF Diabetes Atlas, 11th edition, 2025.)
- Over 85 crore ABHA digital health IDs have been created in India, Nostavia's beachhead market: the data rails exist, but the intelligence layer on top of them does not.

The sensors have shipped. The data rails have shipped. What has never shipped is the layer that interprets the result. Nostavia's thesis is that building that layer once and licensing it to every health company is a larger and more durable business than building one more consumer application.

3. What the company sells

Fragmented health data goes in; structured, predictive, personalised intelligence comes out. The system is white-labelled into a partner's product, integrated into their stack via SDK, or co-branded as their premium tier.

3.1 Inputs

- **Medical records.** lab reports, medications and prior visits.
- **Wearable data.** heart-rate variability, sleep, recovery and stress signals.
- **Nutrition and lifestyle.** daily tracking and food scans.

3.2 Intelligence layer

- **Biomarker decoding.** classification of over 100 markers as optimal, in-range or outlier.
- **Whole-body correlation.** how one system in the body responds to changes in another.
- **Predictive modelling.** digital-twin simulation and personalisation.

3.3 Outputs

- **Effective tracking.** biology rendered comprehensible to a non-clinical user.
- **Precise protocols.** protocols personalised across hundreds of parameters.
- **24/7 AI companion.** continuous intelligence that learns what works for a specific body.

4. Product architecture

4.1 The four layers

Everything beneath the delivery surface is invisible to the partner and difficult to assemble from off-the-shelf components.

LAYER	NAME	FUNCTION
L4	Delivery	White-label app; Intelligence SDK; Wearables SDK; partner dashboards and co-branding
L3	Intelligence core	Dual-brain reasoning; digital twin and predictive modelling; whole-body correlation; protocol engine; AI concierge
L2	Decoding engines	100+ biomarker engine (optimal / in-range / outlier); food bio-impact models; wearable signal normalisation
L1	Ingestion	Native lab-PDF parsing and digital-signature handling; wearable data pipelines

4.2 SOMA Dual-Brain architecture

Personal data is understood and stripped on-device. Only a de-identified clinical brief reaches the cloud model. This architecture is what makes the system private by design and allows margin to expand with scale.

- **SOMA-1B — domain brain (on-device).** A small language model that runs on-device. It understands the user's data, routes queries, personalises the response, and distils the result into a focused, de-identified clinical brief. SOMA-1B is in active development and is not yet shipped; the current pre-seed round funds version 1.
- **Knowledge brain (cloud).** A 70B-class reasoning model adapted for medical use, grounded in clinical evidence and in Nostavia's India-specific reference data. It receives only the de-identified brief, and every output is validated against the company's clinical advisory bench before it reaches a partner.

Live in production today: lab-PDF decoding, the 100+ biomarker engine, food bio-impact modelling, wearable normalisation, the protocol engine and the AI concierge — running on the company's cloud reasoning and orchestration layer.

5. How partners integrate

A partner integrates once. Nostavia remains invisible; the partner's product becomes materially more intelligent.

- **Intelligence SDK.** For platforms and clinics that already operate an application. Lab decoding, food scanning, protocols, the AI concierge and intelligence modules are embedded directly into the existing app. The partner's user experience is unchanged.
- **Wearables SDK.** For any product that requires wearable data. A single integration normalises every major device, including Apple Watch, Oura, WHOOP and Fitbit, replacing a dozen separate provider integrations and custom parsing.
- **White-Label App.** For labs and clinics with no application of their own. A complete, fully branded application carrying the partner's name, with all technology, AI routing and wearable handling operated by Nostavia. No engineering team is required on the partner side.

A single integration adds over 100 lab diagnostics, food-scan intelligence, biomarker correlation, wearable fusion and adaptive protocols. Everything runs under the partner's brand; their users never encounter Nostavia.

6. AI-native services

Alongside the platform, Nostavia sells four productised services. Each replaces work that laboratories and clinics currently pay people to do, or do not do at all. The work is performed by the platform rather than by an analyst bench, so the services are delivered at software margins with no marginal headcount. Each engagement is designed to convert into a platform subscription.

- **Smart Report as a Service.** The interpretation a clinician would spend roughly twenty minutes writing, generated for every routine panel and delivered under the laboratory's brand. Priced per report.
- **Clinical Intake Briefs.** The ten to fifteen minutes of unpaid chart review that precede every new-patient consultation, performed by the engine: reports parsed, outliers flagged, history summarised into a single page. Priced per consult.
- **Re-Test Recall Campaigns.** Reactivation of a laboratory's dormant patients. Nostavia identifies who is due for a re-test and why, drawing on the laboratory's own historical database, and re-engages those patients under the laboratory's name. Priced per campaign, or per converted re-test.
- **Solutions Engineering.** Paid deployments of the Nostavia stack: custom intelligence modules, branded report formats and clinic-side dashboards, built on the company's own SDKs and delivered by the founding engineering team rather than an agency bench.

Service revenue is not included in the recurring-revenue projections in Section 9. It is treated as upside, and as the primary mechanism for landing platform accounts.

7. Market

The category is global. Nostavia enters through India and the United Arab Emirates. The company monetises a software-licensing layer on top of these markets rather than the underlying end-market itself.

	SIZE	DEFINITION
TAM	\$23.4B → \$46.6B	Global longevity and preventive-health market — the category whose platforms and clinics require an intelligence layer (2025 to 2032, approximately 10% CAGR).
SAM	~\$1.6B	Intelligence-layer software spend addressable across India and UAE diagnostics, preventive and longevity clinics, and corporate wellness — a licensing slice of approximately 7% of India's roughly \$19B digital-health market (2025).
SOM	~\$12M	Realistically obtainable three-year beachhead. The company's current plan captures only a fraction of this figure (\$1.35M recurring by 2028).

Sources: Statistics MRC, IMARC, Grand View Research (2025–26). SAM is defined as the software intelligence-layer slice (approximately 7%) of serviceable India and UAE segments; Nostavia licenses the layer, not the full end-market.

8. Go-to-market

Two wedges into a market with no incumbent intelligence layer.

- **United Arab Emirates — the beachhead.** Cash-pay, short sales cycles, and no application gap. Dubai Longevity Authority Law No. 17 of 2026 establishes preventive, data-driven longevity care as a regulated priority, creating a regulated market for the company to sell into. Longevity clinics and hospital groups pay cash and move in weeks rather than quarters. The company has an active pipeline across Dubai longevity clinics and hospital groups.
- **India — the smart-report wedge.** Founder-led diagnostic laboratories, mirroring the category Function Health is scaling in the United States. Diagnostic networks own the data but not the intelligence; Nostavia is that layer. The company has live pilots with Indian diagnostic networks and a warm enterprise pipeline.

The motion: land one partner; reach thousands of end-users under that partner's brand; consented data compounds the model; the next partner becomes easier to win. Enterprise health sales are relationship-led, so the company sells founder-to-founder and prices for multi-year retention.

9. Business model, pricing and projections

9.1 Why the model compounds

- **Low incremental customer-acquisition cost.** Partners acquire the end users; Nostavia monetises the relationship. A single business-development conversation unlocks thousands of paying seats.
- **Multi-year retention.** Deep SDK or white-label integration, combined with consented data, makes the layer costly to remove once embedded.
- **Margin expands with scale.** Inference cost per user falls as volume grows, and the on-device brain removes load from the cloud.
- **Cross-partner network effect.** Every additional partner and every consented user makes the intelligence sharper for all existing partners.

9.2 Pricing

A single model: a monthly platform fee, tiered by scale. The tier sets both the monthly fee and the ceiling on monthly active users.

TIER	PRICE / MONTH	MONTHLY ACTIVE USERS	INCLUDED
Starter SDK	\$299	Up to 5,000	Core infrastructure plus any four intelligence modules, API documentation, 48-hour support
Growth SDK	\$999	Up to 50,000	All eight modules, population analytics, cohort insights, co-branding, 4-hour support and an integration engineer
White-Label Pro	\$1,999	Unlimited	Fully branded application, all modules, priority support; plus a \$1,000 one-time setup fee
Enterprise	from \$5,000	Unlimited	All of the above plus custom AI training on partner data, service-level agreements, on-site onboarding and quarterly reviews

Every tier is recurring. Enterprise and White-Label Pro carry additional setup and custom-training revenue.

9.3 Projections

Projected exit annual recurring revenue derives directly from the pricing tiers above and the partner counts below.

YEAR	PARTNERS	EXIT ARR	MIX
2026	8	\$110K	4 Starter, 3 Growth, 1 Enterprise
2027	27	\$432K	10 Starter, 10 Growth, 4 White-Label, 3 Enterprise
2028	78	\$1.35M	24 Starter, 30 Growth, 15 White-Label, 9 Enterprise

Service revenue (smart reports, recall campaigns, intake briefs, solutions engineering) is excluded from the figures above.

10. Competitive positioning

Consumer health brands such as Function and Superpower build the interpretation loop once, for themselves. Data APIs such as Terra and Vital move signals between devices and applications but never observe clinical outcomes. A partner building the equivalent in-house requires an estimated twelve to eighteen months. Nostavia's position rests on the combination rather than on any single capability.

CAPABILITY	NOSTAVIA	FUNCTION / SUPERPOWER	TERRA / VITAL	BUILD IN-HOUSE
Universal lab-report decoding	Yes	Yes	Yes	12–18 mo
Food bio-impact modelling	Yes	—	—	—
Wearables: one normalised SDK	Yes	—	Yes	12–18 mo
Adaptive, personalised protocols	Yes	Yes	—	12–18 mo
AI concierge on personal biomarkers	Yes	Yes	—	12–18 mo
Delivered under the partner's brand	Yes	—	—	12–18 mo
Cross-partner data network effect	Yes	—	—	—

The company already operates the full India-calibrated stack in production, a lead that a competitor would need twelve to eighteen months to close.

11. Current status and traction

- **Product.** The full stack is live in production. Nostavia's own consumer application runs every layer — lab decoding, wearable fusion, protocols and the AI concierge — and is available on the App Store and Google Play with more than 2,000 users. It serves as the company's reference implementation and de-risks partner integration. It is proof of the technology, not the business.
- **Revenue to date.** Nostavia has billed approximately ₹4.55 lakhs in revenue to date (₹0.8 lakhs in FY 2024–25 and ₹3.75 lakhs in FY 2025–26), filed in the company's income-tax returns. Paying clients include Live360Degrees, a health-technology company whose smart-report engine is built on the Nostavia stack and remains live in use, and IIHMF, the company's incubator, to which Nostavia provides technical support. Live360Degrees has granted logo rights and agreed to serve as a reference.
- **Nature of the revenue.** Revenue billed to date is project and deployment revenue, not platform subscription revenue. No partner is yet on a recurring Starter, Growth, White-Label or Enterprise tier; the recurring-revenue projections in Section 9 therefore begin from zero. Converting the first recurring platform subscription is the company's immediate priority.
- **Related-party disclosure.** IIHMF is the company's incubator. That relationship is disclosed here because it is not an arm's-length commercial engagement and should not be read as independent market validation.
- **Grant funding, stated separately.** The company received a ₹1.25 lakh seed grant under the NIDHI scheme, included within the FY 2025–26 filing figure. It is non-dilutive grant funding and is not counted as revenue in the figures above.
- **Pipeline.** Business-to-business pilots are running with Indian diagnostic networks, and the company holds a warm enterprise pipeline across India and the UAE.
- **In development.** SOMA-1B, the on-device domain brain, is in active development and is funded by the current round.

12. Regulatory, compliance and clinical governance

Handling laboratory, wearable and clinical data across India and the UAE makes compliance a design constraint rather than an afterthought.

- **DPDP-aligned by design.** India's Digital Personal Data Protection Act, 2023: explicit consent, purpose limitation and data minimisation are built into the pipeline.
- **Privacy at the edge.** Personally identifiable information is stripped on-device before any cloud inference. The SOMA-1B domain brain is designed to keep personal data local.
- **Infrastructure, not a device.** Nostavia positions itself as clinician-supervised decision support and as infrastructure, outside high-risk autonomous medical-device classification.
- **UAE and cross-border readiness.** The company aligns to Dubai health-data rules and to the Law No. 17 of 2026 framework, with in-region data handling for UAE partners.

- **Clinical governance.** Protocol outputs are validated against a licensed clinical advisory bench before they are released to any partner.
- **Intellectual property and contracts.** Intellectual-property filings for core algorithms are underway. Licensing and data-processing agreements are standardised per partner.

13. Team

The company is founder-built and supported by a clinical and scientific advisory bench.

- **Aditya Singh — Co-founder and Chief Executive Officer.** Product, go-to-market and the clinical-data pipeline. Co-built the live production AI stack. B.Tech in Biotechnology, MNNIT Allahabad.
- **Anushka Gupta — Co-founder and Chief Technology Officer.** Model architecture, training and MLOps. Built the SOMA stack now running in production. B.Tech in Biotechnology, MNNIT Allahabad.

13.1 Clinical and scientific advisory

Dr. Sparsh Sehdev	MBBS; General Medical Council (UK) registered; 11,000+ patients treated
Aakanksha Pant, PhD	Chief Longevity Officer; Senior Scientist, IISc Bangalore; aging and development biology
Dr. Vivek Rai	MBBS, MD Pharmacology; Principal Investigator, clinical trials; diabetes and hypertension
Sharwani Walke	Chief Nutrition Officer; MSc Clinical Nutrition, University College London
Dr. Akshita Gupta	MBBS; chronic conditions, pediatrics, dermatology and general medicine
Anmol Udhad	Sports nutritionist (ISSA); MBA; formerly Bain & Company
Dr. Dipa Patle	Ayurvedic doctor (BAMS); Head of Ayurvedic Department

14. Financing

Nostavia is raising \$100,000 (approximately ₹96 lakhs) as a pre-seed round on a SAFE. The founders are on deferred compensation, giving the round an operating runway of approximately twelve months. The company has previously received a ₹1.25 lakh non-dilutive seed grant under the NIDHI scheme.

Use of funds:

ALLOCATION	AMOUNT	PURPOSE
AI model and proprietary intelligence (35%)	\$35,000	SOMA-1B training; India-specific reference ranges and biomarker correlation; compute; annotation
SDK, white-label and infrastructure (30%)	\$30,000	Multi-tenant architecture; partner dashboards; co-branding layer; SLA monitoring
Intelligence module development (20%)	\$20,000	One flagship module (cardiovascular), adding a revenue line and raising average contract value

ALLOCATION	AMOUNT	PURPOSE
Clinical validation and legal (15%)	\$15,000	Clinical advisory retainers; DPDP compliance; IP filings; licensing templates

The round is intended to deliver four outcomes: eight paying partners representing approximately \$110,000 in annual recurring revenue; version 1 of SOMA-1B shipped; a DPDP-compliant multi-tenant platform in production; and twelve months of runway sufficient to reach the metrics required for a seed round of \$1 million or more.

15. Company snapshot

Legal entity	Nostavia Technologies Pvt. Ltd.
Headquarters	Lucknow, Uttar Pradesh, India
Category	B2B health-tech infrastructure; white-label health-intelligence layer
Founders	Aditya Singh (CEO); Anushka Gupta (CTO)
Products	Intelligence SDK; Wearables SDK; White-Label App; AI-native services
Proprietary AI	SOMA Dual-Brain: SOMA-1B on-device domain brain (in development) with a 70B-class cloud knowledge brain
Markets	India and the United Arab Emirates first; global category
Buyers	Diagnostic laboratories; longevity and preventive clinics; wellness platforms; fitness apps; insurers
Status	Stack live in production; consumer reference app on both stores with 2,000+ users; ₹4.55 lakhs billed to date; paying clients include Live360Degrees; no recurring platform subscription yet; B2B pilots running
Financing	Raising \$100,000 pre-seed on a SAFE; approximately 12-month runway
Programs	Google for Startups; NVIDIA Inception; Microsoft for Startups; ElevenLabs Grants
Contact	contact@nostaviahealth.com; +91 95983 20558; nostaviahealth.com

16. Boilerplate

16.1 One line

Nostavia is the intelligence layer for the health economy: a whole-body health-intelligence system that health companies embed under their own brand.

16.2 Fifty words

Nostavia Technologies builds the intelligence layer for the health economy. Its whole-body health-intelligence system, delivered as an SDK, a white-label application or AI-native services, lets

diagnostic laboratories, clinics, wellness platforms and insurers turn fragmented lab, wearable and lifestyle data into continuous, personalised intelligence, entirely under their own brand.

16.3 One hundred words

Nostavia Technologies Pvt. Ltd. is a B2B health-tech infrastructure company building the intelligence layer the health economy is missing. Health companies collect enormous amounts of data but cannot think with it: their products stop at activity tracking, generic diet plans and one-time lab reports.

Nostavia's whole-body intelligence system fuses medical records, wearable signals and nutrition data, decodes over 100 biomarkers, models whole-body correlations, and delivers adaptive protocols and a continuous AI companion, invisible behind the partner's brand. It is powered by the SOMA Dual-Brain architecture, which keeps personal data on-device and sends only de-identified clinical briefs to the cloud. The stack is live in production today.

16.4 Positioning statements to keep consistent

- The Stripe for metabolic health. Nostavia powers health companies; it does not compete with them for end users.
- Infrastructure, not an application. The consumer app is a reference implementation and proof, not the business.
- Private by design. Personal data is understood on-device; only de-identified clinical briefs reach the cloud.
- A global problem, entered through India and the UAE, where the data rails already exist.
- The platform is the business. The AI-native services are how the company lands it.
